- Due May 7 by 5pm
- Points 200
- Submitting a file upload
- File Types pdf

Project Reports

To finalize your projects, you need to write up a report. There will not be a demo or presentation.

Your report should be no longer than 12 pages, including figures, tables, and references, using 10 point or larger fonts. Your report can be shorter.

The paper should be single-spaced (two-column is preferred but not required; we also prefer left and right margin justified instead of ragged). We suggest you use latex for formatting your paper, but this is optional. Remember to spell check and read through for grammatical issues.

Papers must be submitted in PDF.

You should submit a report that is similar in style and substance to the conference papers we have been reading. Your report should have enough detail such that someone else could replicate your ideas and re-run similar experiments.

In particular, your report should have the following sections (modify as needed to best showcase what you did and what you learned):

1. **Title and Author List:** Pick a title that describes something specific about what you have accomplished
2. **Abstract:** Describe very briefly what you do, how you do it, and the results.
3. **Introduction:** Motivate why you are studying an interesting and/or important system and/or workload and/or metrics. Describe your approach at a very high level, starting with generalities, and narrow in on your specifics. Summarize your results. Give an outline of the rest of the paper.
4. **Background:** Describe the knowledge the reader needs in order to make this document (mostly) self-contained. For example, how does the distributed system you are evaluating or replicating basically work? What is already known about this system? Where did you get the source code and any workloads from?
5. **Your Previous Experience and Your Motivation:** Why did you want to learn more about this system? What was your previous experience (if any) with any of the relevant software?
6. **Methodology:** Describe what you measured and how you did this in sufficient detail that your

results will make sense, and preferably could be replicated. Describe your experimental platform including the hardware, OS version, other software, or useful tools. Describe your general workloads along with any starting state of the system (e.g., cold or warm caches?); you can give specific details that change across workloads later in the Results section. What existing tools and/or workloads were you able to re-use? What did you need to modify? What did you need to instrument? What new tools or workloads did you create?

7. Results & Discussion:

1. What questions are you trying to answer?
2. Present quantitative measures (tables or graphs) of your results. (Having enough iterations to show confidence intervals or box-whiskers plots would be great.)
3. Include a full description of each experiment and your results. Clearly explain each workload and each graph (along with what is on each axis).
4. For each experiment: What questions are you answering? What is the point of each graph? How much can you explain each of the results you have measured? What supporting metrics do you have? Do the results match your expectations or previous results; why or why not? What conclusions can you draw?

8. Conclusion

Summarize what you did and how effective it was.

9. Bibliography

Properly formatted citations for any resources/papers you used

Feel free to submit this final report before the final due date.

Project 3 Final Report

Criteria	Ratings		Pts
